NON-PROVISIONAL APPLICATION FOR U. S. PATENT UNDER 37 CFR 1.53(b)  
TRANSMITTAL FORM

Attorney Docket No. 1260-2001

Assistant Commissioner for Patents  
Washington, D. C. 20231

Sir:

Transmitted herewith for filing is the  
patent application of:

Inventor(s): Jin K. Song

"EXPRESS MAILING" Mailing Label No.  
EJ134880111US. Date of Deposit: April 25, 2000. I  
hereby certify that this paper is being deposited with the  
U.S. Postal Service Express Mail Post Office to  
Addressee Service under 37 CFR 1.10 on the date  
shown above and is addressed to the Assistant  
Commissioner for Patents, Washington, D.C. 20231.

*Theresa Van Zandt*  
Theresa Van Zandt

For: **A METHOD AND SYSTEM FOR ILLUSTRATING SOUND AND TEXT**

Enclosed are:

- 6 Sheets of formal drawings and 26 pages of Specification (including Abstract)  
x A Declaration/Power of Attorney  
— Assignment with form PTO 1595

Please amend the specification by inserting before the first line the sentence:

This application claims priority under 35 USC § 119 based upon **Provisional Patent  
Application number 60/147,975 filed 08/09/99.**

FEE CALCULATION					FEE
	NUMBER		NUMBER EXTRA	RATE	BASIC FEE \$345.00
Total Claims	30	-20 =	10	X \$9 =	90.00
Independent Claims	5	- 3 =	2	X \$39 =	78.00
Total Filing Fee					\$513.00

A check in the amount of \$513.00 is enclosed. The Assistant Commissioner is hereby authorized to charge any additional fees which may be required, or credit any overpayment to Deposit Account No. 50-0530.

All correspondence related to this application may be addressed to the undersigned at Navarro IP Law Group, 801 E. Campbell Rd. Suite 655, Richardson, Texas 75081.

Attorney Docket No. 1250-2001

Applicant, Jin K. Song  
Serial No. \*\*\*\*\*  
Filed: HEREWITH  
For: A Method for Illustrating Sound and Text

**VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY  
STATUS (37 CFR 1.9(f) and 1.27 (b)) - INDEPENDENT INVENTOR**

As a below named inventor, I hereby declare that I qualify as an independent inventor as defined in 37 CFR 1.9(c) for purposes of paying reduced fees under section 41(a) and (b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled "A Method for Illustrating Sound and Text" described in

- ☒ the specification filed herewith  
☐ application Serial No. \_\_\_\_\_, filed \_\_\_\_\_  
☐ Patent No. \_\_\_\_\_, issued \_\_\_\_\_

I have not assigned, granted, conveyed or licensed and am under no obligation under contract law to assign, grant, convey or license, any rights in the invention to any person who could not be classified as an independent inventor under 37 CFR 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a nonprofit organization under 37 CFR 1.9(e)

Each person, concern or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below.

- ☒ no such person, concern, or organization.  
☐ persons, concerns or organizations listed below\*

\*NOTE: Separate verified statements are required from each named person, concern or organization having rights to the invention averring to their status as small entities. (37 CFR 1.27)

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b))

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed

Re: Patent Application For:  
**A METHOD AND SYSTEM FOR ILLUSTRATING  
 SOUND AND TEXT**  
 Attorney Docket #1260-2001  
Our File: 1260-2001

Dear Sir:

Enclosed for filing please find the following items relating to the above-identified application:

- (1) Non-Provisional Patent Application with Informal Drawings;
- (2) Declaration and Power of Attorney;
- (3) Application Transmittal Form;
- (4) Verified Statement (Declaration) Claiming Small Entity Status
- (5) Check in the amount of \$513.00 to cover the filing fee; and
- (6) Postcard.

Please file the application and return the date-stamped postcards to the corresponding addresses as indicated. In the meantime, if you have any questions or comments concerning this matter, please call the undersigned. Otherwise, please accept the enclosed.

Sincerely,

Arthur I. Navarro

Registration No.: 40,744

Enclosure

cc: Jin K. Song

## **A METHOD AND SYSTEM FOR ILLUSTRATING SOUND AND TEXT**

### CROSS-REFERENCE TO RELATED APPLICATION

5           The application is commonly assigned and related to Provisional Application Serial No. 60/147,975 entitled "A System for Sound Illustrated Text," by Jin K. Song, filed August 9, 1999, the entirety of which is incorporated herein by reference. This application claims priority on the aforementioned related provisional application.

### FIELD OF THE INVENTION

10           The present invention relates generally to a method and system for illustrating sound and text. More particularly, the present invention relates to a method for illustrating sound and text utilizing a book holder adapted to accept a book with pages including illustrations and/or text, at least some of the pages including magnetic signatures. The present invention also relates to a method for electronically storing text and audio content for use in an electronic book reader system.

### BACKGROUND OF THE INVENTION

15           Without limiting the scope of the invention, its background is described in connection with electronic book reader systems.

20           Substantial interest has long been given by the public to books which include sound illustration related to the text and/or illustration content within the

book. Such sound illustrated books range in the industry from children's story books to manuals for learning a foreign language. Their popularity stems from the fact that a user can visually follow the text and/or illustration content in the book while listening to the audible representations corresponding to the text and/or illustration content.

The sound illustrated books enjoyed by the public today include pages comprising a pre-recorded sound chip which includes stored data (e.g., voice and sound). A problem with this type of sound illustrated book is that sound chips generally have a limited amount of memory storage capability. In addition, these chips are directly attached to each page. This can add significantly to the overall weight and girth of the page, or require the use of thick, almost cardboard-like, paper stock.

Other sound illustrated books are those that include a book and an audio cassette tape. The book, however, only has text and/or illustrations. It is the cassette tape that contains pre-recorded audio representations (e.g., voice and/or sound) which correspond with the text and/or illustrations on the pages of the book. In operation, the reader must follow the rhythm of the cassette. When the reader reaches a point for turning the page, a sound or voice instruction is heard indicating such action. If, however, the reader is not following attentively, the audio cassette will continue delivering audio representations until stopped manually, or until the cassette reaches its end. As such, the reader may find him/herself on the wrong page.

#### SUMMARY OF THE INVENTION

The present invention provides for an electronic book reader with a

magnetic signature sensor capable of detecting magnetic signatures attached to pages of a book. The magnetic signatures can be placed at specified locations of the book and used by the reader to retrieve electronic equivalent representations of the text and/or illustrations on the pages for audible delivery.

5

Disclosed in one embodiment of the present invention is a system for illustrating sound and text. The system comprises a book with pages including illustrations and/or text. At least some of the pages include magnetic signatures which are attached in specific locations.

10

The system further comprises a book holder adapted to accept the book. The book holder includes a reading surface, which is a substantially flat platform, comprising a magnetic signature sensor. The magnetic signature sensor is predisposed to detect magnetic signatures on the pages as they are turned by a user viewing the book. The book holder further includes a cartridge slot adapted to receive a cartridge including stored audio representations related to illustrations and/or text on the pages of the book. The book holder also comprises a reading controller which is adapted to interact with the magnetic signature sensor to determine what page, or pages the user is viewing.

15

20

Furthermore, the reading controller is adapted to retrieve audio representations of illustrations and/or text stored on the cartridge corresponding to the page, or pages being viewed by the user, as well as to reproduce audio sounds related to the audio representations through a speaker for listening by the user. The book holder also includes a speaker and a power supply which are communicably coupled with the reading controller. The power supply is adapted to control the activation and de-activation of the book holder.

25

Disclosed in another embodiment of the present invention is a method for

5 illustrating sound and text utilizing a book holder which includes a reading controller, a speaker, and a magnetic signature sensor with one or more reading elements. The book holder is adapted to accept a book with pages including illustrations and/or text, wherein at least some of the pages include magnetic signatures. The method comprises the step of attaching the magnetic signatures in a specified location on pages of the book. The book is then placed on the book holder in a position wherein the magnetic signatures on the pages of the book are properly aligned with the reading elements of the magnetic signature sensor on the reading surface of the book holder. Once in position, the pages of the book can then be turned in order to view the illustrations and/or text therein.

10 The method further comprises the step of detecting the specified locations of the magnetic signatures on the pages utilizing the reading elements of the magnetic signature sensor. As such, the illustrations and/or text on each of the pages are identified by the magnetic signatures attached in the specified locations on the pages.

15 The method also comprises the step of correlating the specified locations with stored audio representations related to the illustrations and/or text on the pages within the book. The audio representations are then retrieved and reproduced in preparation for audible delivery.

20 The method further comprises the step of delivering audible sounds corresponding to the stored audio representations via a speaker to accompany the illustrations and/or text on the page or pages of a book.

25 In another embodiment of the present invention disclosed is a method for electronically storing text and audio content for use in an electronic book reader

system. The method comprises the step of creating electronic equivalent representations of the text and audio content which corresponds to illustrations and/or text on the pages within the book. Thus, the creating step further includes the step of recording sounds and/or words related to the illustrations and/or text of the book for viewing and listening by a user.

The method further comprises the step of storing the electronic equivalent representations in a first electronic memory space. In order to store this data, the electronic equivalent representations are formatted into a digital format. The digital formatted electronic equivalent representations are then sorted into a plurality of addresses (e.g., A0, A1, A2 . . . An) within the first electronic memory space. Once the electronic equivalent representations are sorted, the digital formatted data is packaged utilizing a chip housed within a cartridge means. The cartridge means is then inserted into an electronic book reader system adapted to receive the cartridge means. Upon inserting the cartridge means into the electronic book reader system, a duplicate of the electronic equivalent representations stored in the first electronic memory space is downloaded into a second electronic memory space which is housed within the electronic book reader system. Thus, the electronic equivalent representations are stored in identical addresses in both memory spaces for easy identification and retrieval.

In yet another embodiment of the present invention disclosed is an electronic book reader system for illustrating sound and text. The system comprises a reading surface adapted to accept a book with pages including illustrations and/or text, wherein at least some of the pages include magnetic signatures attached at specified locations. The system also comprises a book support surface adjoined to one side of the reading surface. The book support surface is adjoined to the reading surface by a means adapted to fold in a

manner allowing for both surfaces to meet for easy carrying of the electronic book reader system. As such, the reading surface and book support surface are substantially flat platforms. In addition, the system also comprises a bracket coupled to one side of the reading surface adapted to hold the book in place while the page, or pages are being turned by a user.

The system further comprises a magnetic signature sensor which includes one or more individualized reading elements. The reading elements are pre-aligned on the reading surface in order to correspond with the magnetic signatures at their specified locations on the pages within the book. The magnetic signature sensor is predisposed to detect the magnetic signatures on the pages as they are turned by the user viewing the book.

The system also comprises a reading controller which is adapted to interact with the magnetic signature sensor in order to determine what page, or pages the user is viewing. Communicably coupled with the reading controller is a power supply adapted to activate and de-activate the functionality of the electronic book reader system. The power supply is further coupled with a Light Emitting Diode (LED) indicator for determining the state (e.g., on/off) of the reader system.

The system also comprises a cartridge slot within the electronic book reader adapted to receive a cartridge. The cartridge includes stored audio representations related to the illustrations and/or text of the pages within the book. The stored audio representations of the illustrations and/or text within the cartridge corresponding to the page, or pages being viewed by the user are retrieved and reproduced by the reading controller. A speaker, which is communicably coupled with the reading controller, is then utilized in delivering

the audio representations for listening and reading along with the page, or pages viewed by the user.

Disclosed in another embodiment of the present invention is a cartridge device for storing text and audio content converted into electronic equivalent representations for use in an electronic book reader system. The device comprises a carrier means for housing the electronic equivalent representations. The carrier means can include a box with a top surface, a bottom surface, a first side, a second side, a front side and a back side.

The device further comprises a chip adapted to store the electronic equivalent representations. The chip further includes a first electronic memory space configured to store the electronic equivalent representations. The first electronic memory space also includes a memory array comprising a plurality of addresses (e.g., A1, A2 . . . An) for sorting the electronic equivalent representations. As such, the first electronic memory space is configured to communicate with a second electronic memory space housed within the electronic book reader system. Both memory spaces include identical addresses for easy storing and retrieving of the electronic equivalent representations.

The device further comprises a plurality of pins adapted to communicate with the electronic book reader system. The plurality of pins are located on the front side of the carrier means and are adapted for inserting into the electronic book reader system. Thus, the pins allow for the chip to download the stored data in a first memory space to corresponding addresses in a second memory space.

A technical advantage of the invention is an electronic book reader

system which allows for the reader to follow along one page at a time using digital means. As such, the reader is in control of his or her reading speed and audible representations delivered by a speaker as the reader turns each page.

5

## BRIEF DESCRIPTION OF THE DRAWINGS

For a more complete understanding of the present invention including its features and advantages, reference is made to the following detailed description of the invention in conjunction with the accompanying drawings of which:

Figure 1 illustrates an electronic book reader system according to a preferred embodiment of the present invention;

Figure 2 shows a block diagram of the electronic book reader system in accordance with the preferred embodiment of the present invention;

Figure 3 is a schematic diagram illustrating one embodiment of the present invention;

Figure 4a-4c are magnetic signatures which may be implemented in the preferred embodiment of the present invention;

Figure 5 depicts the relationship between the magnetic signatures and the magnetic signature sensor; and

Figure 6 is a logic diagram depicting the sensor state at each level of one embodiment of the present invention.

Corresponding numerals and symbols in the figures refer to corresponding parts in the detailed description unless otherwise indicated.

#### DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

5

While the making and using of various embodiments of the present invention are discussed in detail below, it should be appreciated that the present invention provides many applicable inventive concepts which can be embodied in a wide variety of specific contexts. The specific embodiments discussed herein are merely illustrative of specific ways to make and use the invention, and do not delimit the scope of the invention.

10

15

20

To better understand the invention, reference is made to Figure 1, which depicts an electronic book reader system 10 for illustrating sound and text, in accordance with the preferred embodiment of the present invention. The electronic book reader 10 comprises a reading surface 14 and a book support surface 16, which are substantially flat platforms. The book support surface 16 is adjoined to one side of the reading surface 14 by a means adapted to fold in a manner allowing for both surfaces 14,16 to meet for easy carrying of the electronic book reader system 10. The reading surface 14 is adapted to accept a book 18 with pages 20. On the other hand, the book support surface 16 is adapted to support the pages 20 viewed by a user. Together, the book support surface 16 and the reader surface 14 form a book holder 12.

25

The book 18 accepted by the reading surface 14 further comprises pages 20 including illustrations and/or text. Each of the pages 20 include a magnet 22 which allows for the page, or pages being viewed by the user to remain open on the reading surface 14 and book support surface 16. Some of the pages 20 also

include magnetic signatures 24 which are attached at specified locations on the pages 20. Magnetic signatures 24 are utilized in identifying the page 20 being viewed by the user, as well as detecting the content of the particular page 20.

5

The electronic book reader system 10 also comprises a magnetic signature sensor 26 which is incorporated as part of the reading surface 14. The magnetic signature sensor 26 includes one or more individualized reading elements 28. These reading elements 28 are pre-aligned on the reading surface 14 in order to correspond with the magnetic signatures 24 at their specified locations. The magnetic signature sensor 26 is predisposed to detect the magnetic signatures 24 on the pages 20 as they are turned by a user viewing the book 18. In operation, the book 18 is placed on the book holder 12 and held in place by a bracket 30 which is located at the bottom edge of the reading surface 14. Holding the book 18 in place is important in order to allow the reading elements 28 to properly correspond with the magnetic signatures 24 on the pages 20.

10

15

20

The electronic book reader system 10 further comprises a cartridge 34, or digital means (e.g., CD), and a cartridge slot 36. The cartridge slot 36 is part of the book holder 12 and is adapted to receive the cartridge 34. The cartridge 34 can include stored audio representations related to the illustrations and/or text on the page, or pages 20. Once the cartridge 34 is inserted into cartridge slot 36, the power can then be turned on, indicated by an LED indicator 38. Audio representations of the illustrations and/or text on pages 20 can then be heard through a speaker 44. The volume of the audio representations heard through the speaker 44 can be controlled by a volume controller 40 which allows for enjoyable listening while reading along with the pages 20 viewed by the user.

25

With reference to Figure 2, a block diagram of the electronic book reader system for illustrating sound and text 10 is shown in accordance with the preferred embodiment of the present invention. In triggering the sensor properties of the system 10, a magnetic signature 24 attached in a specified location on a page 20 within a book 18 must make contact with a magnetic signature sensor 26, which comprises one or more individualized reading elements 28. Once the book 18 has been placed on the book holder 12, a user can then turn each page 20 of the book 18 individually in order to view illustrations and/or text on some of the pages 20. Upon the turning of each page 20, the magnetic signature 24 located on the page 20 being viewed will make contact with an individualized reading element 28 which is pre-aligned on the reading surface 14 of the book holder 12. Once the magnetic signature 24 has been detected by its corresponding reading element 28, the magnetic signature sensor properties 26 are triggered. The reading controller 42, which is communicably coupled with the magnetic signature sensor 26, is adapted to interact with magnetic signature sensor 26 in order to determine what page, or pages 20 the user is viewing. A correlation is then made between the detected specified location via the magnetic signature 24 and the stored audio representations related to the illustrations and/or text on the page, or pages 20 of the book 18. The objective is to retrieve only the audio representations corresponding to the text and/or illustrations on the detected page 20 so as to allow the user to listen and follow such text and/or illustrations. The audio representations, may include words and/or music, for example.

The components housed within the book holder 12 are operated by a power supply 46, which may include, for example, 3V batteries. The power supply 46, which is communicably coupled with the reading controller 42, is adapted to activate and de-activate the functionality of the electronic book reader

system 10. The power supply 46 is, for example, activated by an on/off switch (not shown). In addition, a speaker 44 is also communicably coupled with the reading controller 42 and further adapted to deliver audio representations in order for the user to listen and read along with the page, or pages 20 being viewed by the user. Such audio representations can be retrieved from a cartridge 34 which includes stored electronic equivalent representations related to the illustrations and/or text corresponding to the pages 20.

Turning now to Figure 3, a schematic diagram illustrating one embodiment of the present invention is shown and denoted generally as 50. As previously discussed, each of the pages 20, which include magnetic signatures 24, are turned individually in order to activate the sensor properties 70. Each magnetic signature 24 corresponds with one individualized reading element 28. An array of reading elements 28, together form a magnetic signature sensor 26 located on the reading surface 14 of the book holder 12.

In one embodiment, Page 1 of book 18 can include illustrations and/or text. As Page 1 is viewed by a user on the reading surface 14 of the book holder 12, the magnetic signature 24 on Page 1 will correspond with a pre-aligned reading element 28 on the reading surface 14. The magnetic signature 24 contacts the reading element 28 of the magnetic signature sensor 26, and a bridge is formed between the two sensor properties. A signal for Page 1 is then sent through the logic 64 contained within the reading controller 42. The logic 64 of the reading controller 42 contains addresses (e.g., P2.0, P2.1...P5.1) which correspond with the pins 72 of the magnetic signature sensor 26. Page 1 will then have a signal carried by a current which will correspond with address (e.g., P2.0) 74 of the reading controller logic 64. This allows for Page 1 to be identified as such in order to retrieve its contents.

The reading controller 42 is adapted to interact with the magnetic signature sensor 26 in order to determine what page, or pages 20 the user is viewing. The reading controller 42 via logic 64 will then communicate with the corresponding address in the system 10 internal memory, or second memory space 52, which contains the corresponding electronic equivalent representations. The electronic equivalent representations include text and audio content which is stored on a chip (not shown) in a cartridge 34. Prior to storing, the text and audio content is converted into a digital format. This data is then stored on the chip comprising a first memory space 62. The first electronic memory space 62 includes a memory array which comprises a plurality of addresses (e.g., A1, A2 . . . An) for sorting the electronic equivalent representations. When the cartridge 34 housing the chip including the first electronic memory space 62 is inserted into the cartridge slot 36 of the electronic book reader system 10, the digital data stored on the chip is downloaded into corresponding addresses (e.g., A1, A2...An) in the second memory space 52. Thus, each address will contain the electronic equivalent representations corresponding to the page, or pages 20 which are being viewed by the user. The electronic equivalent representations are then delivered via AOUT 66, or an audio output signal. The audio output signal 66 is then carried to the reading controller 42, which is communicably coupled with a speaker 44. Speaker 44 is adapted to deliver the audio representations carried out by AOUT 66 for listening and reading along with the page, or pages 20 viewed by the user. Only the page, or pages 20 being viewed by the user will be delivered by the speaker 44 in order that the user may control his/her speed of reading. The system 10 functions using a power supply 46 which is communicably coupled with the reading controller 42. Power supply 46 is adapted to activate and de-activate the functionality of the electronic book reader system 10. The power supply 46 may include, for example, a 3V battery 80.

With reference to Figures 4a-4c, therein are shown magnetic signatures which may be implemented in the preferred embodiment of the present invention. In one embodiment of the present invention, as shown in Figure 4a, the array of magnetic signatures 24, which are attached to at least some of pages 20 of a book 18, may include magnets with polarization (e.g., N and S) on both ends of each magnet. If the magnetic signature 24 with polarizations on either end of the magnet is utilized, the magnetic signature sensor 26 comprising one or more individualized reading elements 28 must correspond accordingly. Other variations of magnetic signatures 24 which may be implemented in a preferred embodiment of a present invention may include magnetic signatures 24 which have polarization on the top and bottom surfaces of the magnetic signature 24 and/or magnetic signatures 24 with polarization on either side of the magnetic signature 24. Again, regardless of the array of magnetic signatures 24 which are utilized in the system 10, the magnetic signature sensor 26 must be able to detect the corresponding magnetic signature 24 via the reading elements 28.

With reference to Figure 5, therein is shown the relationship between the magnetic signatures 24 and the magnetic signature sensor 26. In one embodiment, a book 18 may include five (5) pages 20, each containing illustrations and/or text therein. Therefore, each of the five (5) pages 20 will include a magnetic signature 24 which is attached at a specified location on each of page 20. The magnetic signatures 24 are small in size and will not require the page, or pages 20 to be significantly altered.

The reading surface 14 of the system 10 comprises a magnetic signature sensor 26 which includes one or more individualized reading elements 28. In one embodiment, only five (5) of the reading elements 28 will be utilized. The

reading elements 28 are pre-aligned on the reading surface 14 in order to correspond with the magnetic signatures 24 at their specified locations on each of the pages 20.

5 A user will then place the book 18 containing five (5) of pages 20 on the reading surface 14. As the user views the illustrations and/or text on Page 1, the magnetic signature 24 on Page 1 will be detected by the reading element 28 of the magnetic signature sensor 26 corresponding to the magnetic signature 24 on Page 1. As the magnetic signature 24 of Page 1 comes into contact with the  
10 corresponding reading element 28, a Low (L) voltage signal will be depicted as shown in Figure 6. The other magnetic signatures 24 will remain in a High (H) state until detected. Such signal from the corresponding sensor will then communicate with the logic 64 contained within the reading controller 42. It is the logic 64 which enables the reading controller 42 to retrieve the electronic  
15 equivalent representations corresponding to the text and/or illustrations on Page 1 and deliver them to in speaker 44 from a second memory space 52.

20 This sequence will then continue with the user turning to Page 2, which includes illustrations and/or text. As shown in Figure 6, while the user is viewing Page 2, two Low (L) voltages will be detected. This will, however, indicate that the user is on Page 2, and thus, retrieve the corresponding electronic equivalent representations stored in the second memory space 52 for delivery in an audible manner to the user. Only the electronic equivalent representations  
25 corresponding to the text and/or illustrations on Page 2 will be delivered by speaker 44 to the user. No additional sound will be heard until the user decides to turn to Page 3. As such, the user can control the speed of his/her reading of book 18 for enjoyment purposes.

While this invention has been described with a reference to illustrative embodiments, this description is not intended to be construed in a limiting sense. Various modifications and combinations of the illustrative embodiments as well as other embodiments of the invention will be apparent to persons skilled in the art upon reference to the description. It is, therefore, intended that the appended claims encompass any such modifications or embodiments.

5

What is claimed is:

1. A system for illustrating sound and text comprising:
  - a book with pages including illustrations and/or text, at least some of said pages including magnetic signatures;
  - a book holder adapted to accept said book, said book holder having a reading surface with a magnetic signature sensor, a cartridge slot, a reading controller, a speaker, and a power supply; and
  - a cartridge adapted to be inserted in said cartridge slot, said cartridge including stored audio representations related to said illustrations and/or text of said pages;
- wherein said magnetic signature sensor is predisposed to detect magnetic signatures on said pages as they are turned by a user viewing said book, and wherein said reading controller is adapted to interact with said magnetic signature sensor to determine what page or pages said user is viewing and to retrieve audio representations of illustrations and/or text stored on said cartridge corresponding to said page or pages being viewed by said user and to reproduce audible sounds related to said retrieved audio representations through said speaker for listening by said user.
2. The system according to Claim 1 wherein said magnetic signatures are attached to at least some of said pages in a specified location in order to be detected by said magnetic signature sensor.
3. The system according to Claim 1 wherein said magnetic signature sensor further comprises one or more individualized reading elements, said reading elements pre-aligned on said reading surface in order to correspond with said magnetic signatures at their specified locations.

1        4.        The system according to Claim 1 wherein said reading surface is a  
2        substantially flat platform.

1        5.        The system according to Claim 1 wherein said power supply is  
2        communicably coupled with said reading controller and said speaker, said power  
3        supply further adapted to control the activation and de-activation of said book  
4        holder.

1        6.     A method for illustrating sound and text utilizing a book holder including a  
2        reading controller, a speaker, and a magnetic signature sensor with one or more  
3        reading elements, said book holder adapted to accept a book with pages  
4        including illustrations and/or text, at least some of said pages including magnetic  
5        signatures, the method comprising the steps of:

6                attaching said magnetic signatures in a specified location on said pages;  
7                detecting the specified locations of said magnetic signatures utilizing said  
8        reading elements of said magnetic signature sensor;  
9                correlating said specified locations with stored audio representations  
10       related to said illustrations and/or text of said pages; and  
11                delivering audible sounds corresponding to said stored audio  
12       representations via said speaker to accompany the illustrations and/or text on  
13       said page or pages.

1        7.     The method according to Claim 6 wherein said attaching step is followed  
2        by the step of placing said book on said book holder in a position wherein said  
3        magnetic signatures on said pages of said book are properly aligned with said  
4        reading elements of said magnetic signature sensor.

1        8.     The method according to Claim 7 wherein said placing step is followed by  
2        the step of turning said pages of said book in order to view illustrations and/or  
3        text therein.

1 9. The method according to Claim 8 wherein said turning step further  
2 includes the step of identifying the illustrations and/or text on said pages utilizing  
3 said magnetic signatures attached in specified locations on said pages detected  
4 by said reading elements of said magnetic signature sensor.

1 10. The method according to Claim 6 wherein said delivering step is preceded  
2 by the step of retrieving the stored audio representations of said illustrations  
3 and/or text corresponding to said page or pages being viewed by said user.

1 11. The method according to Claim 10 wherein said retrieving step is followed  
2 by the step of reproducing the stored audio representations of said illustrations  
3 and/or text retrieved corresponding to said page or pages being viewed by said  
4 user.

1 12. A method for electronically storing text and audio content for use in an  
2 electronic book reader system, the method comprising the steps of:  
3 creating electronic equivalent representations of said text and audio  
4 content; and  
5 storing said electronic equivalent representations in a first electronic  
6 memory space.

1 13. The method according to Claim 12 wherein said creating step further  
2 includes the step of recording sounds and/or words corresponding to illustrations  
3 and/or text of a book.

1 14. The method according to Claim 12 wherein said storing step further  
2 includes the step of formatting said electronic equivalent representations into a  
3 digital format.

1 15. The method according to Claim 12 wherein said storing step further  
2 includes the step of sorting said electronic equivalent representations into a  
3 plurality of addresses (e.g., A0, A1, A2 . . . An) within said first electronic memory  
4 space.

1 16. The method according to Claim 12 wherein said sorting step is followed  
2 by the step of packaging said electronic equivalent representations stored in said  
3 first electronic memory space utilizing a chip housed within a cartridge means.

1 17. The method according to Claim 16 wherein said packaging step further  
2 includes the step of inserting said cartridge means into said electronic book  
3 reader system adapted to receive said cartridge means.

18. The method according to Claim 17 wherein said inserting step is followed by the step of downloading a duplicate of said electronic equivalent representations stored in said first electronic memory space into a second electronic memory space housed within said electronic book reader system.

1 19. An electronic book reader system for illustrating sound and text  
2 comprising:  
3 a reading surface adapted to accept a book with pages, said pages  
4 including illustrations and/or text, at least some of said pages including magnetic  
5 signatures attached at specified locations;  
6 a book support surface adjoined to one side of said reading surface, said  
7 book support surface adapted to support said page or pages viewed by a user;  
8 a magnetic signature sensor including one or more individualized reading  
9 elements, said magnetic signature sensor predisposed to detect said magnetic  
10 signatures on said pages as they are turned by said user viewing said book;  
11 a bracket coupled to said reading surface adapted to hold said book in  
12 place while said page or pages are turned;  
13 a reading controller adapted to interact with said magnetic signature  
14 sensor in order to determine what page or pages said user is viewing; and  
15 a power supply communicably coupled with said reading controller  
16 adapted to activate and de-activate the functionality of said electronic book  
17 reader;  
18 a cartridge slot within said electronic book reader adapted to receive a  
19 cartridge including stored audio representations related to said illustrations  
20 and/or text of said pages; and  
21 a speaker communicably coupled with said reading controller adapted to  
22 deliver said audio representations for listening and reading along with said page  
23 or pages viewed by said user.  
24 wherein said reading controller is adapted to retrieve and reproduce said  
25 audio representations of said illustrations and/or text stored on said cartridge  
26 corresponding to said page or pages being viewed by said user.

1 20. The system according to Claim 19 wherein said reading elements  
2 are pre-aligned on said reading surface in order to correspond with said  
3 magnetic signatures at their specified locations.

1 21. The system according to Claim 19 wherein said reading surface  
2 and said book support surface are substantially flat platforms.

1 22. The system according to Claim 21 wherein said reading surface  
2 and said book support surface are adjoined by a means adapted to fold in a  
3 manner allowing for both surfaces to meet for easy carrying of said electronic  
4 book reader system.

5 23. The system according to Claim 19 wherein said reader further  
6 comprises a volume control adapted to control the volume of the deliver of said  
7 audio representations for enjoyable listening by said user.

8 24. The system according to Claim 19 wherein said power supply is  
9 coupled with a Light Emitting Diode (LED) indicator for determining the state  
10 (e.g., On/Off) of said electronic book reader system.

1 25. A cartridge device for storing text and audio content converted into  
2 electronic equivalent representations of said text and audio content for use in an  
3 electronic book reader system, the device comprising:

4 a carrier means for housing said electronic equivalent representations;  
5 a chip adapted to store said electronic equivalent representations; and  
6 a plurality of pins adapted to communicate with said electronic book  
7 reader system.

1 26. The device according to Claim 25 wherein said carrier means includes a  
2 box with a top surface, a bottom surface, a first side, a second side, a front side  
3 and a back side.

4 27. The device according to Claim 26 wherein said front side includes said  
5 plurality of pins adapted for inserting into said electronic book reader system.

6 28. The device according to Claim 25 wherein said chip further comprises a  
7 first electronic memory space configured to store said electronic equivalent  
representations.

1 29. The device according to Claim 28 wherein said first electronic memory  
2 space further includes a memory array comprising a plurality of addresses (e.g.,  
3 A1, A2 . . . An) for sorting said electronic equivalent representations.

1 30. The device according to Claim 28 wherein said first electronic memory  
2 space is configured to communicate with a second electronic memory space  
3 housed within said electronic book reader system.

## A METHOD AND SYSTEM FOR ILLUSTRATING SOUND AND TEXT

### ABSTRACT

5 A method and system (10) for illustrating sound and text comprising a book (18) with pages (20) including illustrations and/or text, wherein at least some of the pages (20) include magnetic signatures (24). The system further includes a book holder (12) adapted to accept the book (18). As such, the book holder (12) has a reading surface (14) with a magnetic signature sensor (16), a cartridge slot (36), a reading controller (42), a speaker (44), and a power supply (46). The system also comprises a cartridge (34) adapted to be inserted in the cartridge slot (36). The cartridge (34) includes stored audio representations related to the illustrations and/or text of the pages (20). The magnetic signature sensor (16) is predisposed to detect the magnetic signatures (24) on the pages (20) as they are turned by a user viewing the book (18). Furthermore, the reading controller (42) is adapted to interact with the magnetic signature sensor (16) to determine what page or pages (20) the user is viewing and to retrieve the audio representations of the illustrations and/or text stored on the cartridge (34) corresponding to the page or pages (20) being viewed by the user. Thus, the reading controller (42) reproduces the audible sounds related to the retrieved audio representations through the speaker (44) for listening by the user.

ATTORNEY'S DOCKET NO.

1260-2001

**APPLICATION FOR UNITED STATES PATENT****DECLARATION AND POWER OF ATTORNEY**

As a below named inventor, I declare that my residence, post office address and citizenship are as stated below next to my name; that I verily believe that I am the original, first and sole inventor if only one name is listed below, or an original, first and joint inventor if plural inventors are named below, of the subject matter which is claimed and for which a patent is sought on the invention entitled as set forth below, which is described in the attached specification, that I have reviewed and understand the contents of the specification, including the claims, as amended by any amendment specifically referred to in the oath or declaration; that no application for patent or inventor's certificate on this invention has been filed by me or my legal representatives or assigns in any country foreign to the United States of America; and that I acknowledge my duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, section 1.56(a);

I further declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true, and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.
